

## Multi-Coloured Remote Lighting

The 15L biOrb Halo has 6 Multicoloured LED's fitted into the top of the aquarium controlled by a remote handset (A). If the lights are not coming on when you press the **ON** button check the inline power switch (B) is in the **ON** position and you have the remote control pointed directly at the front of the aquarium with no obstructions (C).

### Selecting a mode

The lights switch on in **WHITE** mode. There are 16 further colour modes which can be selected using the remote control. If you want to set your own special colour, you can press the **COLOUR MODE BUTTON** which will scroll the lights through all colours until you stop it by pressing the **SETTING BUTTON** .

### Dimming the lights

All colours start at 100% intensity. If you find the lights too bright you can dim them down in 20% reductions (from 80% to 20%) using the **BRIGHTNESS BUTTONS** on the right of the remote. If you want to return to full intensity press any other button to reset.

### Troubleshooting

**Q. When I press the on button there are no lights on the aquarium?**

A. Check the inline power button is in the **ON** position. If the lights still don't respond, make sure the remote is pointing directly at the front of the aquarium. Finally, check the battery in the remote.

**Q. I have to stand very close to the aquarium for the remote to work?**

A. The battery of the handset probably needs replacing with new CR2025 as soon as possible.

**Q. Is the remote handset waterproof?**

A. No, the handset must not be submerged in water and if it fails to work after contact with water you will need to purchase a replacement.

**Q. When I open the lid there is water dripping down the outside of the tank.**

A. Ensure you have the evaporation tray correctly installed and the feed hole plug in place. With a soft cloth, gently wipe away any remaining water.

**Q. I don't like the colour I've selected, how can I change it or return to white light?**

A. If you are not happy with your colour choice you can press the **(W)** button or the **OFF** then the **ON** button to return to 100% white light.
